

# iTime Developer Documentation

---

## *Introduction*

This documentation is written by Yuming Shen (Ethan Shin). The objective of writing this documentation is to provide a basic architecture, API and models that are used in the iOS application "**iTime**".

The whole documentation consists of three parts: Architecture, Views and API(models).

## *Tools used in the development*

- **Swift**
  - Swift is the programming language used in this project.
- **Realm**
  - The Object-Oriented Database (OODB) used for our local database.
- **Lean cloud**
  - The mobile backend as a service (BaaS) provider, which manages all functionalities of the notification.
- **Google/Firebase**
  - Several Google APIs have been used in the project
- **Apple developer account/Testflight**
  - Responsible for testing the application
  - other configurations

# *Architecture*

Figure 1: Project Architecture in Xcode

The project architecture in Xcode has been shown in Figure 1. The whole project comprised of six main parts. The Views part includes all view controller files. All utility functions are in Utilities folder and models used in the application are in Models folder. Files in Extensions folder extends some classes with some convenient functions. BaseClasses and Resources contains other important resources for instance, icon images.

---

## Views

### Tabbar ViewController

Figure 2 Tabbar

- There are five main components in the tabbar
  - Meetings, Activities, Functional Button, Calendar and Contacts.

- In this project, the tabbar is simply created by using storyboard (**Main.storyboard**)

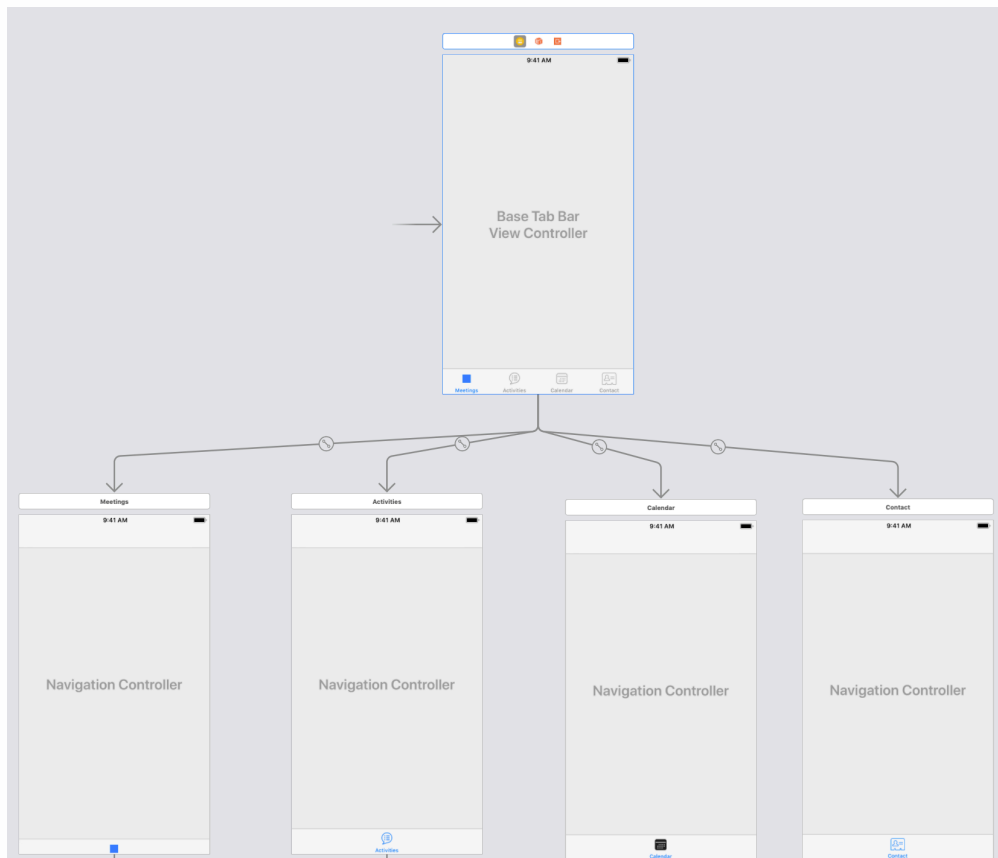

Figure 2: Main Storyboard

- Tabbar-related codes are written in **BaseTabBarViewController.swift**

```
class BaseTabBarViewController: UITabBarController {
    override func viewDidLoad(){
        //Notification setting
        if UserUtility.isLoggedin(){
            // Utility initiation
            // setup socket
        }
        // UI part
    }
    func syncFunctions{
        // sync functions
    }
    @objc func longPressed(){
        // long-press
    }
}
```

## Meetings ViewController

- The Meeting module is one of the most important parts of the iTime. The Meeting module comprises of three independent components: **Invitations module, Hosting module and Coming module.**
- The Invitation part displays all events that the current user has been invited. And all meetings that are created by the user will be shown in the Hosting module. In addition, if the user has voted for a certain meeting, and the event has not outdated, those events will be moved into the Coming module.
- In order to provide the convenience for hosting events, the information about how many people have voted/refused/no reply will be shown in the event cell.
- In addition, outdated events will be presented after the “out of date” line so that users can manage them quickly.
- If the user confirmed to attend an event, the left part of the event cell will change from **Vote** to **Going**, as you can see in the left screen of the figure 3.1.

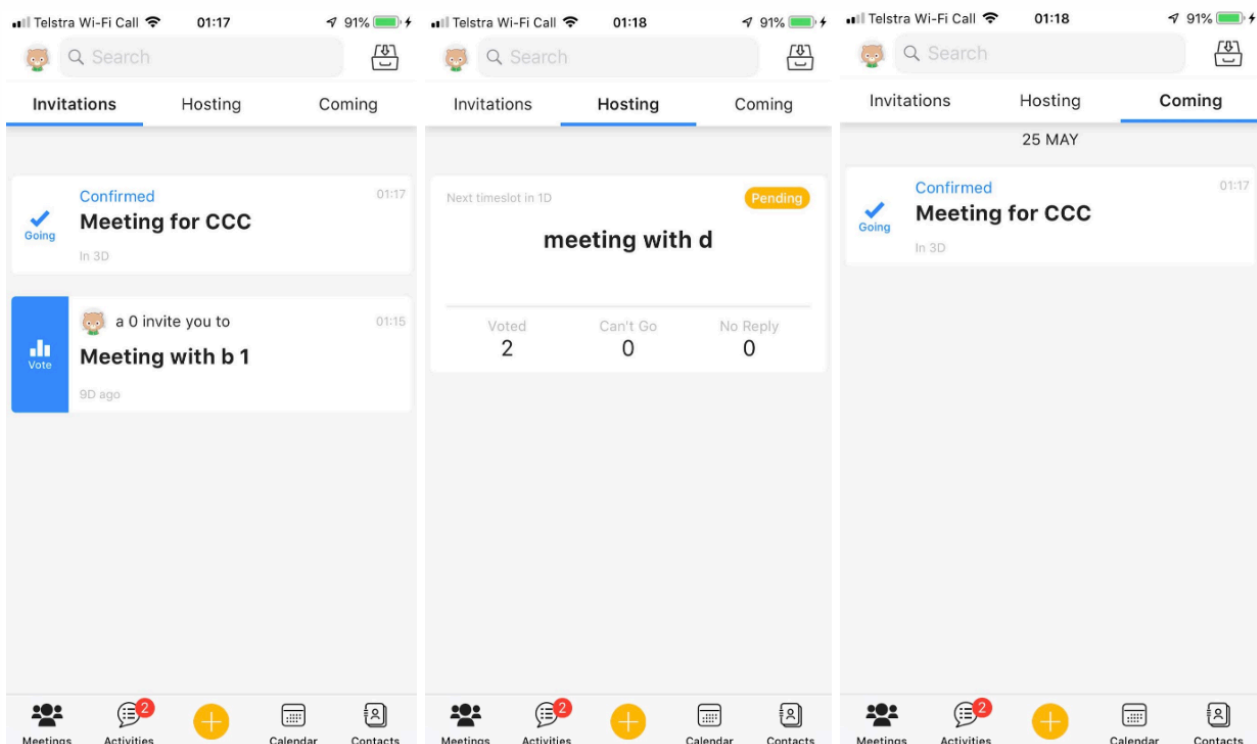

Figure 3.1 . Meeting Module

- **Code structure**

- XLPagerTabStrip is a Container View Controller that allows us to switch easily among a collection of view controllers.
- In this case, the BaseMeetingViewController is the container view and Invitation VC, Hosting VC and ComingVC are subVCs of the MeetingVC.

```
let subViewController1 = MeetingInvitationViewController()

let subViewController2 = MeetingHostingViewController()

let subViewController3 = MeetingComingViewController()
```

- BaseMeetingViewController is the VC holds the whole structure of the meeting views.

```
class BaseMeetingViewController:
    UIButtonPagerTabStripViewController {
    override func viewDidLoad() {
        // setupBarButton should be called before
        super.viewDidLoad()
        setupBarButton()
        super.viewDidLoad()
        setupBasicUI()
        setupNavigationBar()
        setupNotification()
    }

    // UI functions
    func setupBarButton {

    }
    func setupNavigationBar{

    }
    //@objc func functions
    @objc func searchBarTapped() {

    }
}
```

## Activities ViewController

- All event-related notification messages will be presented in the ActivityModule.
- It can be seen from Figure 3.2 that there are two main parts: the last cell is for official messages (from the iTime) and others are for recording event-related messages. When the user taps the event, three cells containing information of changes will appear and tap any of them will jump to the event detail page. The iTime messages view contains all other changes such as share calendar creation and permission setting changes.

Figure 3.2 Activity Module

- Code Structure

```
class ActivityViewController: UIViewController,
UITableViewDelegate, UITableViewDataSource {
    override func viewDidLoad() {
        // add notification observer
        // reloadActivities
        // set UI
    }
}
```

```

// Second part is about right corner ... button
var rightConnerBtnVC : ActivityShowMoreViewController?
// The Third part is about cell
}

extension ActivityViewController:
UIPopoverPresentationControllerDelegate{
    // pop over effect
}

```

## Main Functional Button ViewController

- The orange button in the middle of the tabbar is the main function button (addBtn).
- When the user taps the button just once, the event creation buttons appear, and the user can not only create public events, but also group meetings and personal event. which shows in Figure 3.3.

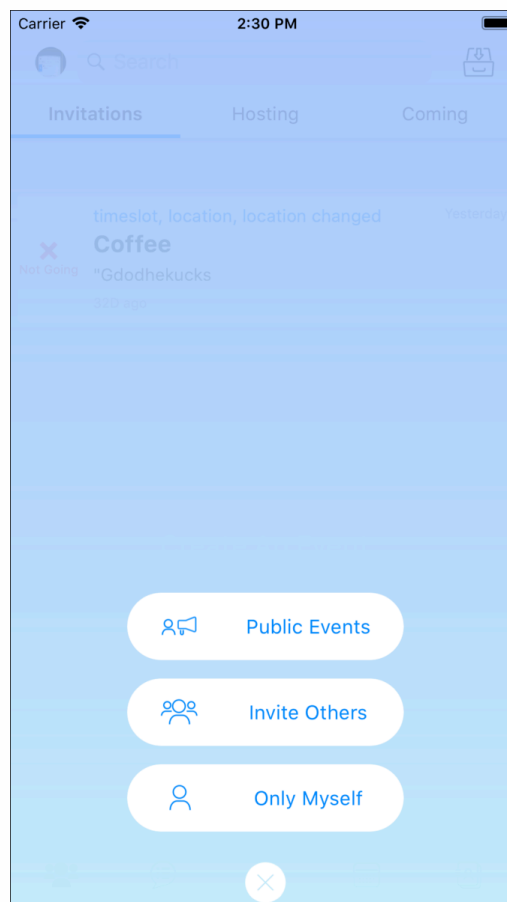

Figure 3.3 CreateEventViewController

- code for Main Functional Button ViewController

```
// Add Button
let selfBar = self.tabBar as! CustomTabBar
    addButton = selfBar.addButton
    addButton.addTarget(self, action:
#selector(self.addBtnTapped(_:)), for: .touchUpInside)
    let longGesture = UILongPressGestureRecognizer(target:
self, action: #selector(longPressed))
    addButton.addGestureRecognizer(longGesture)
```

```
// Create Event VC
class CreateEventViewController: UIViewController {
    // did load
    private func setupBasic(){
        self.view.backgroundColor = UIColor.clear

        // solo event button
        let soloView = UIView(frame: CGRect())
        let soloImageView = UIImageView(frame: CGRect())
        soloImageView.image = #imageLiteral(resourceName:
"icon_event_onlyme")
        let soloLabel = UILabel(frame: CGRect())
        // UI setup part
        createSoloBtn.addSubview(soloView)

        // group event button
        let groupView = UIView(frame: CGRect())
        let groupImageView = UIImageView(frame: CGRect())
        groupImageView.image = #imageLiteral(resourceName:
"icon_event_inviteothers")
        let groupLabel = UILabel(frame: CGRect())
        // UI setup part
        createGroupBtn.addSubview(groupView)
```

```

//The public event button
let publicView = UIView(frame: CGRect())
let publicImageView = UIImageView(frame: CGRect())

publicImageView.image = #imageLiteral(resourceName:
"icon_popover_publicevent")
let publicLabel = UILabel(frame: CGRect())

// UI setup part
}
}

```

- When the user taps the button longer than 0.5 seconds, a new pop menu appears with some other hotkeys (Figure 3.4).

Figure 3.4: LongPress Effect

```

@objc func longPressed(action:UILongPressGestureRecognizer){
    let actions: [PopupMenuDefaultAction] = [
        // PopupMenuDefaultActions
    ]
    if action.state == .began {
        // when the action begins
    } else if action.state == .ended{
        // when the action ends
    }
}
}

```

## Calendar ViewController

- In the calendar view, all events will be presented in the corresponding cells in the view. User is able to see the calendar in day, week or agenda type. It can be seen from the figure 3.5 that the left screenshot is the calendar in day type, the middle one shows the calendar in week type and the right one is in agenda type.

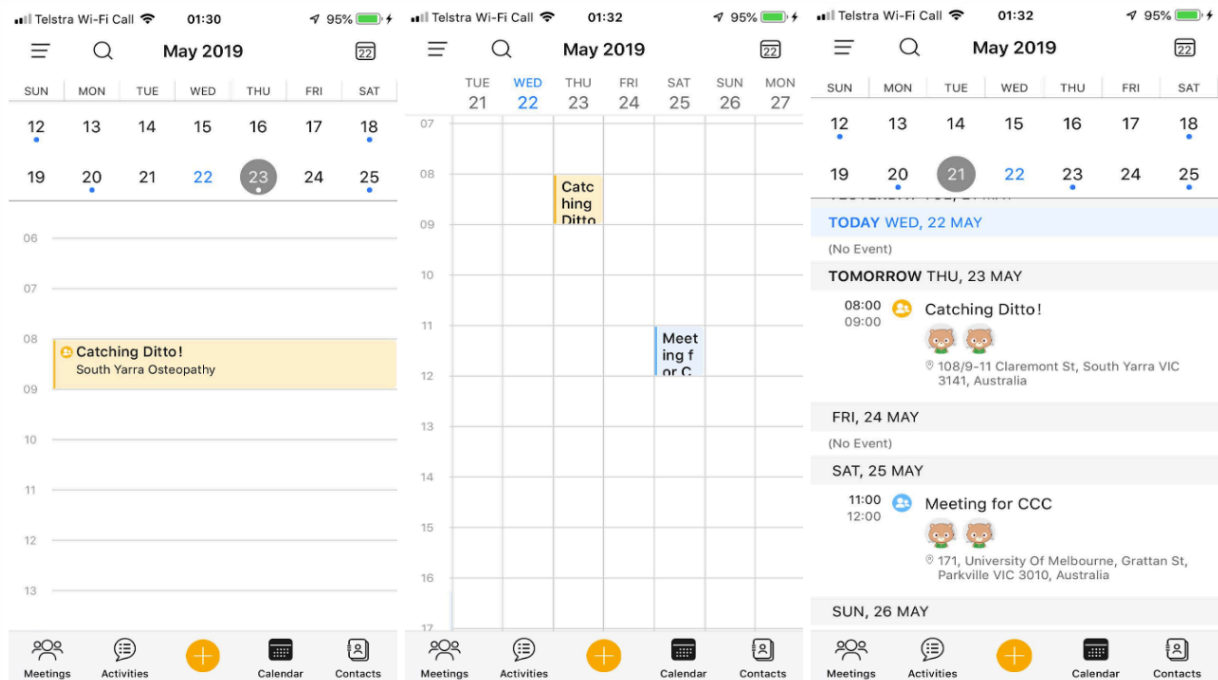

Figure 3.5: Calendar Module

```
enum CalendarViewType{
    case day
    case week
    case agenda
}
```

```
// monthView appears when the calendar type is day or agenda
var upperMonthView: BasicCalendarView!
var agendaVC: AgendaTableViewController!
var agendaView: UIView!
// addChildViewController part -- in viewDidLoad part
addChildViewController(agendaVC)
agendaVC.agendaViewDelegate = self
agendaVC.didMove(toParentViewController: self)
agendaView = agendaVC.view
view.addSubview(agendaView)
```

## Contact ViewController

- The Contacts Module displays all contact information, users can add or find users that they want to connect with. If the user click any one of the user cells, the app will jump to this user's profile detail page. And the user can directly invite that user to the new Event or subscribe this user.

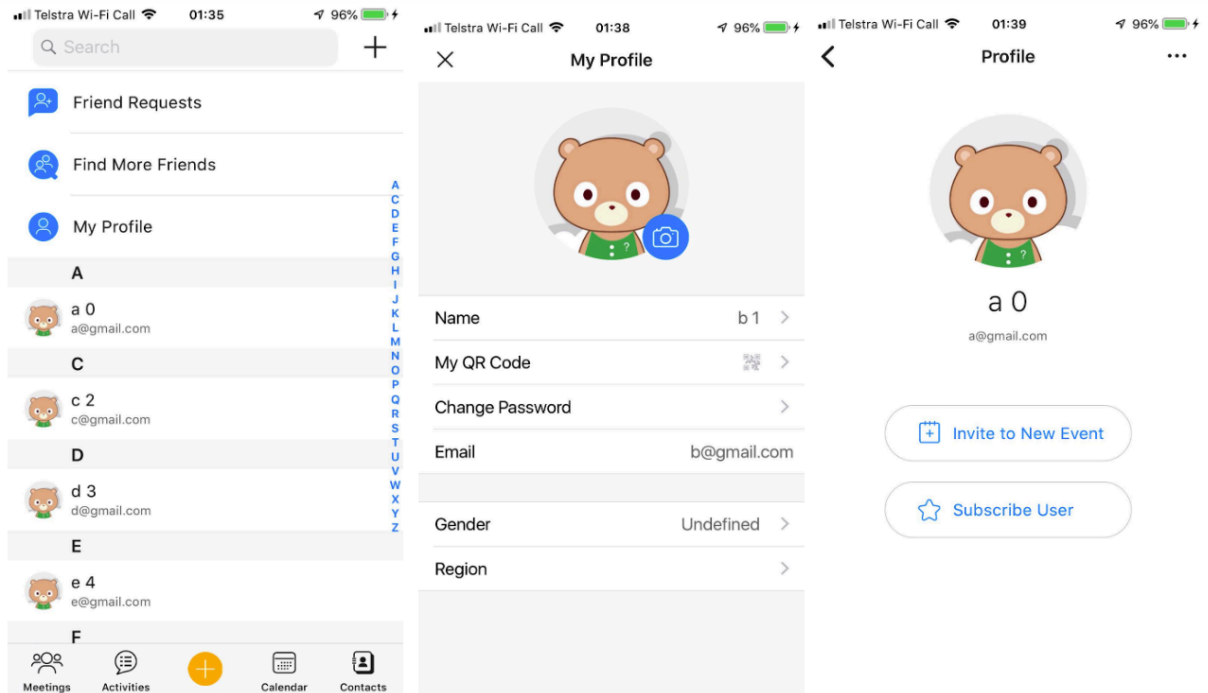

Figure 3.6: Contact Module

```
class ContactsViewController: UIViewController{

    var tableView = UITableView()
    var viewModel = ContactsViewModel()
    var popoverController:UIPopoverPresentationController!

    override func viewDidLoad() {
        super.viewDidLoad()

        setupBasic()
        setupNavBar()
        setupTableView()
        reloadContactsViewController()
    }
}
```

```

func setupBasic(){
    // UI & notification
}

func setupNavBar(){
    // search bar and addbtn
}

func setupTableView(){
    // UI
}

// @objc functions
@objc func searchBarTapped() {
}

@objc func addFriendsBtnTapped(_ sender: UIBarButtonItem){
}

@objc func reRenderContactsViewNotification(_ notification:
Notification){
}
}

// Tableview delegate
extension ContactsViewController: UITableViewDelegate,
UITableViewDataSource{
}

// popover effect
extension ContactsViewController:
UIPopoverPresentationControllerDelegate,
ContactsMoreOptionsDelegate{
}

```

## Utilities

- The Utilities functions contains most of utility functions that can be called in other places
- Take the **EventUtility** as an example, following are some utility functions in the **EventUtility** class:
  - **class func initContacts()**
    - Get all contact information from the local database (realm).
  - **class func initBlockedUser()**
    - Get the list of blocked users from the local database.
  - **class func initFriendRequest()**
    - Get all friend request information from the local database.
  - **class func postRerenderContactsViewNotification()**
    - post notification to tell corresponding views to re-render.
  - **static func getContactsWithAlphabetOrder()**
    - used when reload the view model, put the new contact information in alphabetic order.
  - **static func checkIfSubscribed(\_ contactUid: String)->Bool**
    - returns a boolean value to tell whether the user has subscribed a specific user or not.
  - **class func listBlockedUsersRemote(parameters)**
    - This is a HTTP GET request to the server to get all blocked users.
  - **class func listContactsRemote**
    - Same as above, a HTTP GET request to get all contact information.
  - **class func sendFriendRequest()**
    - A POST request to the server to send a friend request to other users.
  - **class func deleteContact()**
    - Delete a specific contact with a user.
  - **class func unSubscribeUser()**
    - A corresponding function to the subscribe function.
  - **class func updateContacts**
    - When sync an updated contact from the server, update it to the view.

## API & Model

- `baseUrl = ConfigurationManager(environment:.prod).baseUrl()`
- `baseApiUrl = "\ (baseUrl)/api"`
- `baseSocketUrl = "http://socket.timagic.net"`

▪

### API:

<b>account</b>	Operations about account	>
<b>calendar</b>	Access to Petstore orders	>
<b>contact</b>	Operations about contact info	>
<b>event</b>	Operations about events	>
<b>meeting</b>	Operations about meetings	>
<b>activity</b>	Operations about activity msgs	>
<b>setting</b>	Operations about settings	>
<b>user</b>	Operations about users	>

Schemas	∨
<b>ITimeEvent</b>	> ↩
<b>ITimeCalendar</b>	> ↩
<b>ShareParameter</b>	> ↩
<b>ITimeLocation</b>	> ↩
<b>ITimeTimeslot</b>	> ↩
<b>Setting</b>	> ↩

## account Operations about account

**GET** `/account/list` Get binding accounts

**Parameters** Try it out

No parameters

**Responses**

Code	Description	Links
200	<code>successful operation</code>	No links
405	<code>Controls Accept header.</code> <code>Validation exception</code>	No links

**POST** `/account/google/unbind/{account_uid}` Delete binding acc of google

**Parameters** Try it out

Name	Description
<b>account_uid</b> <span>★ required</span> string (path)	Uid of the account to be deleted

**Responses**

Code	Description	Links
200	<div>successfully deleted</div>	No links
405	<div>Controls Accept header.</div> <div>Validation exception</div>	No links

POST

/account/university/unbind/{account\_uid} Delete binding acc of unimelb

Parameters

Try it out

Name	Description
<b>account_uid</b> * required string (path)	Uid of the account to be deleted

Responses

Code	Description	Links
200	<div>successfully deleted</div>	No links
405	<div>Controls Accept header.</div> <div>Validation exception</div>	No links

POST

/account/google/bind/{authcode} import the calendar from google calendar

Warning: Deprecated

Parameters

Try it out

Name	Description
<b>authcode</b> * required string (path)	authentication code from google

Responses

Code	Description	Links
200	<div>successfully binded</div>	No links
405	<div>Validation exception</div>	No links

POST

/account/university/bind/unimelb

import the calendar from unimelb calendar

Warning: Deprecated

Parameters

Try it out

No parameters

Request body

application/json

Example Value

Schema

```
{  "username": "string",  "password": "string"}
```

Responses

Code	Description	Links
200	<div>successfully binded</div>	No links
405	<div>Validation exception</div>	No links

calendar

Access to Petstore orders

GET

/calendar/list

Get the whole calendar

Parameters

Try it out

No parameters

Responses		
Code	Description	Links
200	<div>successful operation</div>	No links
Controls Accept header.		
405	<div>Validation exception</div>	No links

POST

/calendar/insert

insert a new calendar

Parameters

Try it out

No parameters

Request body

\*/\*

iTimeCalendar

Example Value | Schema

```
{  "uid": "string",  "visibility": 0,  "color": "string",  "access": "string",  "status": "string",  "extra": "string",  "summary": "string",  "source": "string",  "calendarUid": "string",  "userId": 0,  "createdAt": "string",  "updatedAt": "string",  "accountUid": "string",  "deleteLevel": 0,  "email": "string"}
```

Responses

Code	Description	Links
200	<div>successful operation</div>	No links
Controls Accept header.		
405	<div>Validation exception</div>	No links

POST

/calendar/share/{calendarUid}/change

change permission level of a user

Parameters

Try it out

Name	Description
<b>calendarUid</b> * required string (path)	Uid of the calendar

Request body

\*/\*

info to share

Example Value | Schema

```
{  "sharedUser": [    "string"  ],  "access": "string"} 
```

Responses

Code	Description	Links
200	<div>successfully operation</div>	No links
405	<div>Controls Accept header.</div> <div>Validation exception</div>	No links

POST

/calendar/share/{calendarUid} share calendar with added people

Parameters

Try it out

Name	Description
<b>calendarUid</b> * required string (path)	Uid of the calendar

Request body

\*/\*

info to share

Example Value | Schema

```
{
  "sharedUser": [
    "string"
  ],
  "access": "string"
}
```

Responses

Code	Description	Links
200	<div>successfully operation</div> <div>Controls Accept header.</div>	No links
405	<div>Validation exception</div>	No links

**POST** /calendar/unshare/{calendarUid}/{userId} unshare calendar with user

Parameters

Try it out

Name	Description
<b>calendarUid</b> * required string (path)	Uid of the calendar
<b>userId</b> * required integer (path)	Uid of the user

Responses

Code	Description	Links
200	<div>successfully operation</div> <div>Controls Accept header.</div>	No links
405	<div>Validation exception</div>	No links

**POST** /calendar/share/{calendarUid}/revoke revoke the shared calendar

Parameters

Try it out

Name

Description

calendarUid ★ required

string

(path)

Uid of the calendar

Request body

application/json

Example Value

Schema

```
{  "parameters": {    "additionalProp1": "string",    "additionalProp2": "string",    "additionalProp3": "string"  }}
```

Responses

Code

Description

Links

200

successfully operation

No links

405

Controls Accept header.

Validation exception

No links

POST

/calendar/share/{calendarUid}/status

get the calendar's status

Parameters

Try it out

Name

Description

calendarUid ★ required

string

(path)

Uid of the calendar

Responses

Code

Description

Links

200

successfully operation

No links

Controls Accept header.

Code	Description	Links
405	<div>Validation exception</div>	No links

POST

/calendar/update/{calendarUid} update the calendar

Parameters

Try it out

Name	Description
<b>calendarUid</b> <span>★ required</span> string (path)	Uid of the calendar

Request body

\*/\*

Example Value | Schema

```
{  "uid": "string",  "visibility": 0,  "color": "string",  "access": "string",  "status": "string",  "extra": "string",  "summary": "string",  "source": "string",  "calendarUid": "string",  "userId": 0,  "createdAt": "string",  "updatedAt": "string",  "accountUid": "string",  "deleteLevel": 0,  "email": "string"}
```

Responses

Code	Description	Links
200	<div>successfully operation</div> <div>Controls Accept header.</div>	No links
405	<div>Validation exception</div>	No links

POST

/calendar/delete/{calendarUid} delete the calendar

Parameters

Try it out

Name

Description

calendarUid ★ required

string

(path)

Uid of the calendar

Request body

\*/\*

Example Value | Schema

```
{  "uid": "string",  "visibility": 0,  "color": "string",  "access": "string",  "status": "string",  "extra": "string",  "summary": "string",  "source": "string",  "calendarUid": "string",  "userId": 0,  "createdAt": "string",  "updatedAt": "string",  "accountUid": "string",  "deleteLevel": 0,  "email": "string"}}
```

Responses

Code

Description

Links

200

successfully operation

Controls Accept header.

No links

405

Validation exception

No links

POST

/calendar/unsubscribe/{calendarUid} unsubscribe the calendar

Parameters

Try it out

Name

Description

calendarUid ★ required

string

(path)

Uid of the calendar

Responses

Code	Description	Links
200	<div>successfully operation</div>	No links
Controls Accept header.		
405	<div>Validation exception</div>	No links

contact Operations about contact info

GET

/contact/user/list get the user list -- (NOT SURE)

Parameters

Try it out

Name	Description
syncToken <i>(query)</i>	["syncToken": syncToken as AnyObject]

Responses

Code	Description	Links
200	<div>successfully operation</div>	No links
Controls Accept header.		
405	<div>Validation exception</div>	No links

GET

/contact/friend\_request/list list all friend requests

Parameters

Try it out

Name	Description
syncToken string <i>(query)</i>	["syncToken": syncToken as AnyObject]

Responses

Code	Description	Links
200	<div>successfully operation</div> <div>Controls Accept header.</div>	No links
405	<div>Validation exception</div>	No links

POST

/contact/friend\_request/send/{friendUserId}/{invitationSource} send the request to add a friend

Parameters

Try it out

Name	Description
<b>friendUserId</b> * required string (path)	UserId
<b>invitationSource</b> * required string (path)	source of invitation, e.g "itime"

Responses

Code	Description	Links
200	<div>successfully operation</div> <div>Controls Accept header.</div>	No links
405	<div>Validation exception</div>	No links

POST

/contact/friend\_request/confirm/{freqUid} send the confirm ack

Parameters

Try it out

Name	Description
<b>freqUid</b> * required string (path)	Uid of FriendRequest

Responses

Code	Description	Links
200	<div>successfully operation</div>	No links
Controls Accept header.		
405	<div>Validation exception</div>	No links

POST

/contact/friend\_request/reject/{freqUid} reject the friend request

Parameters

Try it out

Name	Description
<b>freqUid</b> <span>★ required</span> string (path)	Uid of FriendRequest

Responses

Code	Description	Links
200	<div>successfully operation</div>	No links
Controls Accept header.		
405	<div>Validation exception</div>	No links

POST

/contact/delete/{contactUid} delete the contact

Parameters

Try it out

Name	Description
<b>contactUid</b> <span>★ required</span> string (path)	Uid of the user in contact

Responses

Code	Description	Links
------	-------------	-------

Code	Description	Links
200	<div>successfully operation</div>	No links
405	<div>Controls Accept header.</div> <div>Validation exception</div>	No links

event Operations about events

GET

/event/getLink/{eventId} get the public event link

Parameters

Try it out

Name	Description
<b>eventId</b> * required string (path)	Uid of the event
<b>syncToken</b> * required string (query)	synchronized token

Responses

Code	Description	Links
200	<div>successfully operation</div>	No links
405	<div>Controls Accept header.</div> <div>Validation exception</div>	No links

GET

/event/getPublicEvent/{eventId} get the public event

Parameters

Try it out

Name	Description
<b>eventId</b> * required string (path)	Uid of the event

Name

Description

syncToken

\*

 required

string

(query)

synchronized token

Responses

Code

Description

Links

200

successfully operation

No links

405

Controls Accept header.
